

Web-based course in experimental economics

(24h, cours en anglais)

Experimental economics are the study of individual decision-making and collective interactions using experiments, i.e. observing individual or collective decision-making in controlled experimental settings. At the intersection of economics, psychology, and social psychology, the field has gained in importance over the last years. The lecture is an introduction to the methods and main contributions of experimental economics to the understanding of social interactions in economic decisions. Among others, topics such as experiments on markets, public goods, trust and reciprocity are covered. Interactive, a large part of the lecture is devoted to the reproduction by the students of the results of classical experiments. For more information: lecture outline available on the IEP's website.
